

Databases and SQL for Data Science with Python

Course Overview

If there is a shortcut to becoming a Data Scientist, then learning to think and work like a In this course you will learn SQL inside out- from the very basics of Select statements to advanced concepts like JOINS.

You will:

- write foundational SQL statements like: SELECT, INSERT, UPDATE, and DELETE
- filter result sets, use WHERE, COUNT, DISTINCT, and LIMIT clauses.
- differentiate between DML & DDL
- CREATE, ALTER, DROP and load tables.

Benefits of Enrolling in a Course:

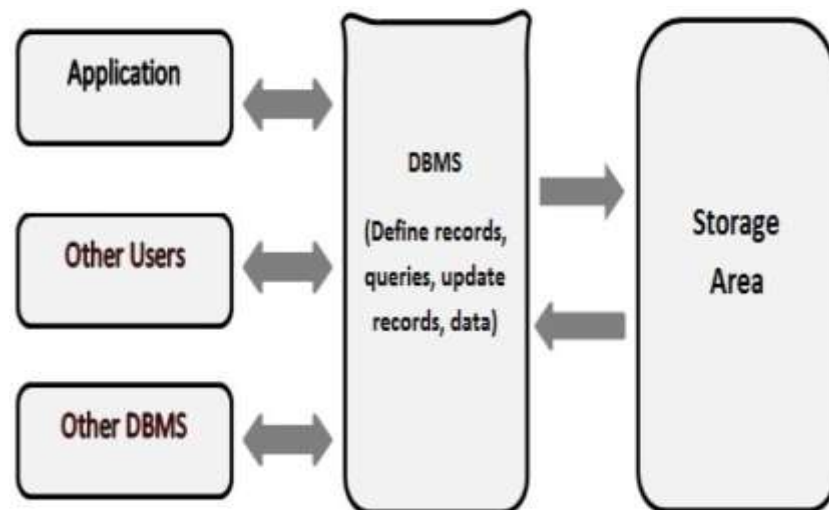

- Analyse data within a database using SQL and Python.
- Create a relational database and work with multiple tables using DDL commands.
- Construct basic to intermediate level SQL queries using DML commands.
- Compose more powerful queries with advanced SQL techniques like views, transactions, stored procedures, and joins.

Sessions Content

- Getting started with SQL.
- Introduction to relational database and Tables
- relational database and Tables
- Intermediate SQL
- Intermediate SQL Part 2
- Accessing database using Python
- Accessing database using Python Part 2
- Advanced SQL for Data Engineer
- Advanced SQL for Data Engineer

What are Databases?

- A database is an organized collection of data, generally stored and accessed electronically from a computer system. It supports the storage and manipulation of data.
- In other words, databases are used by an organization as a method of storing, managing and retrieving information.

Types of Databases

Depending upon the usage requirements, there are following types of databases available in the market:

- Centralized database
- Distributed database
- Personal database
- End-user database
- Commercial database
- NoSQL database
- Operational database
- Relational database
- Cloud database
- Object-oriented database
- Graph database Here is a detailed article on, [Types of Database Management Systems](#).

Advantages of using Databases

There are many advantages of databases

- Reduced data redundancy
- Reduced updating errors and increased consistency
- Greater data integrity and independence from application programs
- Improved data access to users through the use of host and query languages
- Improved data security
- Reduced data entry, storage, and retrieval costs

Disadvantages of using Databases

There are many disadvantages of databases

- Although databases allow businesses to store and access data efficiently, they also have certain disadvantages
- Complexity
- Cost
- Security
- Compatibility

Some examples of Databases

Some of the most popular databases are

- Oracle Database
- Sybase
- MySQL
- IBM db2

What is SQL?

- SQL (Structured Query Language): Is used to perform operations on the records stored in the database, such as updating records, inserting records, deleting records, creating and modifying database tables, views, etc.
- SQL is not a database system, but it is a query language.

Database Transaction

- A transaction is an executing program that forms a logical unit of database actions.
- It includes one or more database access operations such as insert, delete and update.
- The database operations that form a transaction can either be embedded within an application program or they can be specified interactively via a high-level query language such as SQL.

Database Transaction Properties

- Transactions should possess several properties, often called the ACID properties:
 1. Atomicity
 2. Consistency
 3. Isolation
 4. Durability

Database Schema

A schema is a group of related objects in a database. There is one owner of a schema who has access to manipulate the structure of any object in the schema. A schema does not represent a person, although the schema is associated with a user that resides in the database.

Data types

A data type determines the type of data that can be stored in a database column. The most commonly used data types are:

1. Alphanumeric: data types used to store characters, numbers, special characters, or nearly any combination.
2. Numeric
3. Date and Time

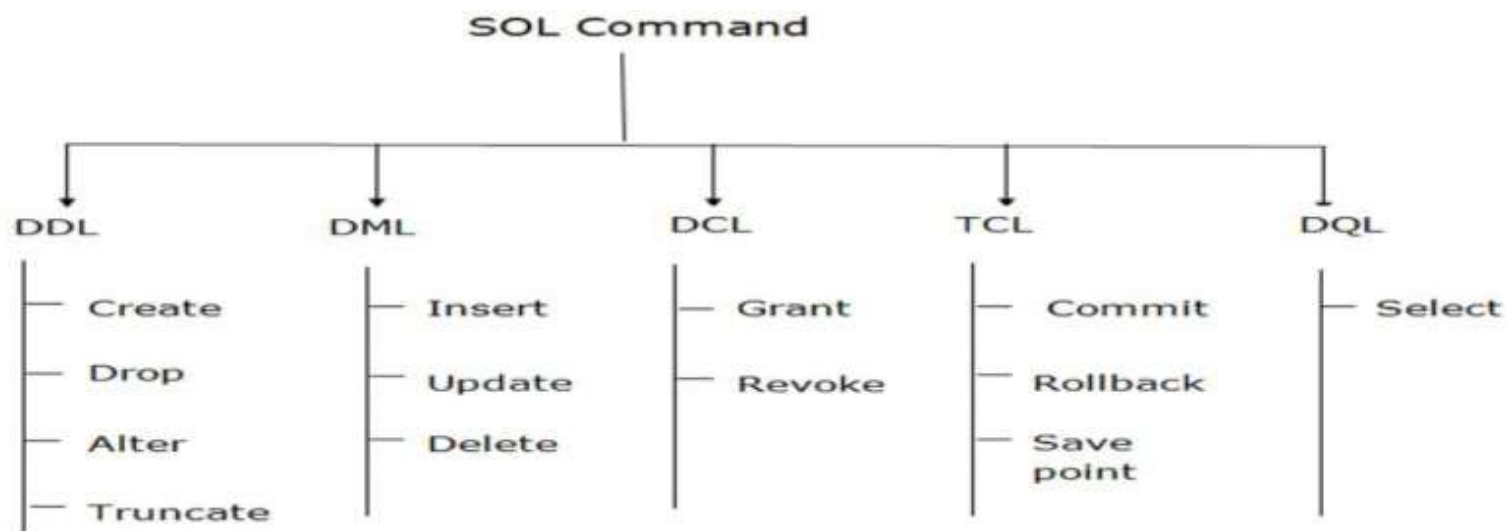

Database Constraints

- Primary Key (Not Null + Unique)
- Not Null
- Unique Key
- Referential Integrity (FK)
- Check

SQL Commands

- SQL commands are instructions. It is used to communicate with the database. It is also used to perform specific tasks, functions, and queries of data.
- SQL can perform various tasks like create a table, add data to tables, drop the table, modify the table, set permission for users.

Types of SQL Commands

Data Definition Language (DDL)

- DDL changes the structure of the table like creating a table, deleting a table, altering a table, etc.
- All the command of DDL are auto-committed that means it permanently save all the changes in the database.

Here are some commands that come under DDL:

- CREATE
- ALTER
- DROP
- TRUNCATE

Data Definition Language (DDL)

- CREATE It is used to create a new table in the database

```
CREATE TABLE TABLE_NAME (COLUMN_NAME DATATYPES[,....]);
```

Example

```
CREATE TABLE EMPLOYEE(Name VARCHAR2(20), Email VARCHAR2(100), DOB DATE);
```

Data Definition Language (DDL)

- DROP: It is used to delete both the structure and record stored in the table.

```
DROP TABLE table_name;
```

Example

.

```
DROP TABLE EMPLOYEE;
```

Data Definition Language (DDL)

- ALTER: It is used to alter the structure of the database. This change could be either to modify the characteristics of an existing attribute or probably to add a new attribute.

```
ALTER TABLE table_name ADD column_name COLUMN-definition;
```

Example

```
ALTER TABLE STU_DETAILS ADD(ADDRESS VARCHAR2(20));  
ALTER TABLE STU_DETAILS MODIFY (NAME VARCHAR2(20));
```

Data Definition Language (DDL)

- TRUNCATE: It is used to delete all the rows from the table and free the space containing the table.

```
TRUNCATE TABLE table_name;
```

Example

```
TRUNCATE TABLE EMPLOYEE;
```

Data Definition Language (DDL)

- TRUNCATE: It is used to delete all the rows from the table and free the space containing the table.

```
TRUNCATE TABLE table_name;
```

Example

```
TRUNCATE TABLE EMPLOYEE;
```

Data Manipulation Language (DML)

- DML commands are used to modify the database. It is responsible for all form of changes in the database.
- The command of DML is not auto-committed that means it can't permanently save all the changes in the database. They can be rollback.
- Here are some commands that come under DML:
 - INSERT
 - UPDATE
 - DELETE

Data Manipulation Language (DML)

- INSERT: The INSERT statement is a SQL query. It is used to insert data into the row of a table

```
INSERT INTO TABLE_NAME
VALUES (value1, value2, value3, .... valueN);
```

Example:

```
INSERT INTO javatpoint (Author, Subject) VALUES ("Sonoo", "DBMS");
```

Data Manipulation Language (DML)

- UPDATE: This command is used to update or modify the value of a column in the table.

```
UPDATE table_name SET [column_name1= value1,...column_nameN = valueN] [WHERE CONDITION]
```

Example:

```
UPDATE students
SET User_Name = 'Sonoo'
WHERE Student_Id = '3'
```

Data Manipulation Language (DML)

- DELETE: It is used to remove one or more row from a table.

```
DELETE FROM table_name [WHERE condition];
```

Example:

```
DELETE FROM javatpoint  
WHERE Author="Sonoo";
```

Data Control Language (DCL)

- DCL commands are used to grant and take back authority from any database user.

Here are some commands that come under DCL:

- Grant
- Revoke

Data Control Language (DCL)

- Grant: It is used to give user access privileges to a database.

Example:

```
GRANT SELECT, UPDATE ON MY_TABLE TO SOME_USER, ANOTHER_USER;
```

Data Control Language (DCL)

- Revoke: It is used to take back permissions from the user.

Example:

```
REVOKE SELECT, UPDATE ON MY_TABLE FROM USER1, USER2;
```

Transaction Control Language(TCL)

- TCL commands can only use with DML commands like INSERT, DELETE and UPDATE only.
- These operations are automatically committed in the database that's why they cannot be used while creating tables or dropping them.

Here are some commands that come under TCL:

- COMMIT
- ROLLBACK
- SAVEPOINT

Transaction Control Language(TCL)

- Commit: Commit command is used to save all the transactions to the database.

```
COMMIT;
```

Example

```
DELETE FROM CUSTOMERS  
WHERE AGE = 25;  
COMMIT;
```

Transaction Control Language(TCL)

- Rollback: Rollback command is used to undo transactions that have not already been saved to the database.

```
ROLLBACK;
```

Example

```
DELETE FROM CUSTOMERS  
WHERE AGE = 25;  
ROLLBACK;
```

Transaction Control Language(TCL)

- **SAVEPOINT:** It is used to roll the transaction back to a certain point without rolling back the entire transaction.

Example

```
SAVEPOINT SAVEPOINT_NAME;
```

Relational Database Concepts

What You Will Learn

Explain the advantage of the relational model

-- 0
-- 1
-- 1
-- 0

Explain how the Entity name and attributes map to a relational database table

Describe the difference between an entity and an attribute

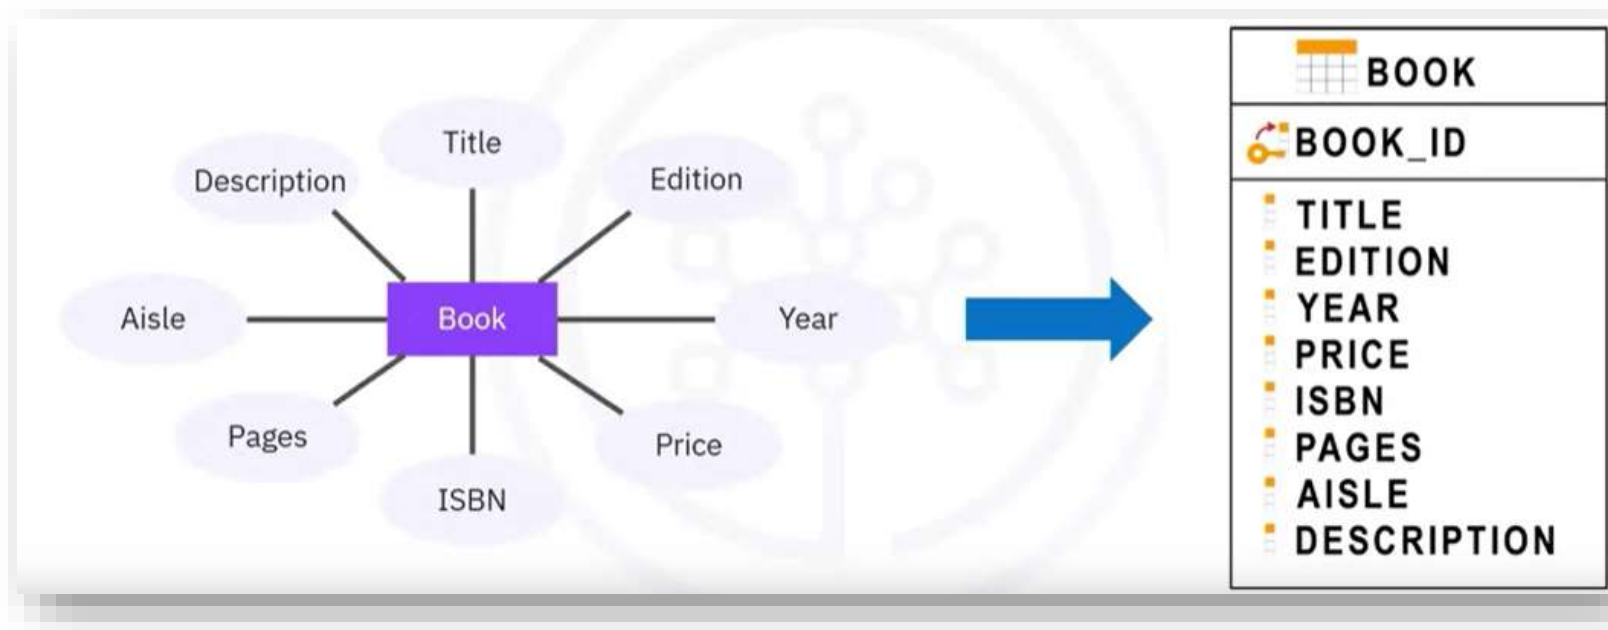

Identify some commonly used data types

Describe the function of Primary Keys

Entity-Relationship Model

- Used as a tool to design relational databases

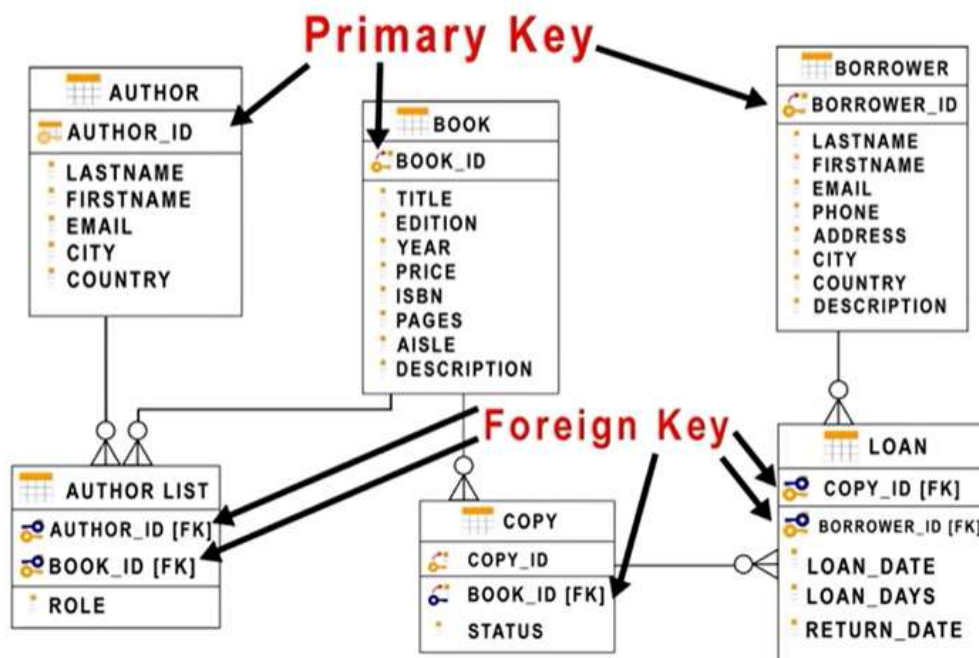

Mapping Entity Diagrams To Tables

- Entities become tables
- Attributes get translated into columns

Table: Book

| Title | Edition | Year | Price | ISBN | Pages | Aisle | Description |
|------------------------------------|---------|------|-------|-------------------|-------|--------|--|
| Database Fundamentals | 1 | 2010 | 24.99 | 978-0-9866283-1-1 | 300 | DB-A02 | Teaches you the fundamentals of databases |
| Getting started with DB2 Express-C | 1 | 2010 | 24.99 | 978-0-9866283-5-1 | 280 | DB-A01 | Teaches you the essentials of DB2 using DB2 Express-C, the free version of DB2 |

Primary keys and Foreign keys

Data Definition Language (DDL)

- CREATE command
- ALTER command
- DROP command
- TRUNCATE command

CREATE Command

- Syntax

```
CREATE TABLE table_name
(column1 DATA_TYPE [CONS_TYPE CONS_NAME],
column2 DATA_TYPE [CONS_TYPE CONS_NAME],... )
```

- Example

```
CREATE TABLE Students
```

```
(ID NUMBER(15) PRIMARY KEY, First_Name CHAR(50) NOT
NULL, Last_Name CHAR(50), Address CHAR(50), City
CHAR(50), Country CHAR(25), Birth_Date DATE);
```

EMPLOYEE

| | | | | | | | | | |
|-------|-------|-------|------------|-------|---------|-----|--------|----------|-----|
| FNAME | MINIT | LNAME | <u>SSN</u> | BDATE | ADDRESS | SEX | SALARY | SUPERSSN | DNO |
|-------|-------|-------|------------|-------|---------|-----|--------|----------|-----|

DEPARTMENT

| | | | |
|-------|----------------|--------|--------------|
| DNAME | <u>DNUMBER</u> | MGRSSN | MGRSTARTDATE |
|-------|----------------|--------|--------------|

DEPT_LOCATIONS

| | |
|----------------|------------------|
| <u>DNUMBER</u> | <u>DLOCATION</u> |
|----------------|------------------|

PROJECT

| | | | |
|-------|----------------|-----------|------|
| PNAME | <u>PNUMBER</u> | PLOCATION | DNUM |
|-------|----------------|-----------|------|

WORKS_ON

| | | |
|-------------|------------|-------|
| <u>ESSN</u> | <u>PNO</u> | HOURS |
|-------------|------------|-------|

DEPENDENT

| | | | | |
|-------------|-----------------------|-----|-------|--------------|
| <u>ESSN</u> | <u>DEPENDENT_NAME</u> | SEX | BDATE | RELATIONSHIP |
|-------------|-----------------------|-----|-------|--------------|

Figure 7.5 Schema diagram for the COMPANY relational database schema; the primary keys are underlined.

DROP Command

- Syntax

DROP TABLE table_name

- Example

DROP TABLE Students

ALTER Command

- ALTER TABLE statement is used to add or drop columns in an existing table.
- Syntax
 - ALTER TABLE table_name ADD column_name datatype
 - ALTER TABLE table_name DROP COLUMN column_name

ALTER Example

| LastName | FirstName | Address |
|-----------|-----------|-----------|
| Pettersen | Kari | Storgt 20 |

To add a column named "City" in the "Students" table:

```
ALTER TABLE Students ADD City varchar(30)
```

Result

:

| LastName | FirstName | Address | City |
|-----------|-----------|-----------|------|
| Pettersen | Kari | Storgt 20 | |

Data Manipulation Language (DML)

- INSERT Command
- UPDATE Command
- DELETE Command
- SELECT Command

INSERT Command

- Syntax

```
INSERT INTO table_name (column1, column2, ...)
VALUES (value1, value2, ...)
```

Table *Store_Information*

| Column Name | Data Type |
|-------------|-----------|
| store_name | char(50) |
| Sales | float |
| Date | datetime |

- Example

```
INSERT INTO Store_Information (store_name, Sales, Date)
VALUES ('Los Angeles', 900, 'Jan-10-1999')
```

INSERT Example 2

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | Nasr City | Cairo |

```
INSERT INTO Students VALUES ('Saleh', 'Ahmed', 'Moharam bak', 'Alex.')
```

Result

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | Nasr City | Cairo |
| Saleh | Ahmed | Moharam bak | Alex. |

INSERT Example 3

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | Nasr City | Cairo |
| Saleh | Ahmed | Moharam bak | Alex. |

INSERT INTO Students (LastName, City) VALUES ('Hassan', 'Assuit')

Result

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | Nasr City | Cairo |
| Saleh | Ahmed | Moharam bak | Alex. |
| Hassan | | | Assuit |

UPDATE Command

- Syntax

UPDATE table_name

SET column_1= new value, column_2= new value
WHERE condition

UPDATE Example

```
UPDATE Store_Information
SET Sales = 500
WHERE store_name = 'Los Angeles' AND Date = 'Jan-08-1999'
```

Before

| <i>store_name</i> | <i>Sales</i> | <i>Date</i> |
|--------------------|---------------|--------------------|
| <i>Los Angeles</i> | <i>\$1500</i> | <i>Jan-05-1999</i> |
| <i>San Diego</i> | <i>\$250</i> | <i>Jan-07-1999</i> |
| <i>Los Angeles</i> | <i>\$300</i> | <i>Jan-08-1999</i> |
| <i>Boston</i> | <i>\$700</i> | <i>Jan-08-1999</i> |

After

| <i>store_name</i> | <i>Sales</i> | <i>Date</i> |
|--------------------|---------------|--------------------|
| <i>Los Angeles</i> | <i>\$1500</i> | <i>Jan-05-1999</i> |
| <i>San Diego</i> | <i>\$250</i> | <i>Jan-07-1999</i> |
| <i>Los Angeles</i> | <i>\$500</i> | <i>Jan-08-1999</i> |
| <i>Boston</i> | <i>\$700</i> | <i>Jan-08-1999</i> |

UPDATE Example 2

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | Nasr City | Cairo |
| Saleh | Ahmed | Moharam bak | Alex. |

UPDATE Students SET Address = '241 El-haram', City = 'Giza'
WHERE LastName = 'El-Sayed'

Result

:

| LastName | FirstName | Address | City |
|-----------------|------------------|----------------|-------------|
| El-Sayed | Mohamed | 241 El-haram | Giza |
| Saleh | Ahmed | Moharam bak | Alex. |

DELETE Command

- Syntax

DELETE FROM table_name

WHERE condition

DELETE Example

```
DELETE FROM Store_Information
WHERE store_name = 'Los Angeles'
```

Before

| <i>store_name</i> | <i>Sales</i> | <i>Date</i> |
|--------------------|---------------|--------------------|
| <i>Los Angeles</i> | <i>\$1500</i> | <i>Jan-05-1999</i> |
| <i>San Diego</i> | <i>\$250</i> | <i>Jan-07-1999</i> |
| <i>Los Angeles</i> | <i>\$300</i> | <i>Jan-08-1999</i> |
| <i>Boston</i> | <i>\$700</i> | <i>Jan-08-1999</i> |

After

| <i>store_name</i> | <i>Sales</i> | <i>Date</i> |
|-------------------|--------------|--------------------|
| <i>San Diego</i> | <i>\$250</i> | <i>Jan-07-1999</i> |
| <i>Boston</i> | <i>\$700</i> | <i>Jan-08-1999</i> |

TRUNCATE Vs DELETE

TRUNCATE TABLE is functionally identical to DELETE statement with no WHERE clause

- TRUNCATE TABLE table_name
- TRUNCATE TABLE customer

Simple Queries

- Syntax

```
SELECT    <attribute list >  
FROM      <table list>  
WHERE     <condition>  
ORDER BY  <attribute list >
```

Examples

- `SELECT *`
`FROM departments;`
- `SELECT emp_id, emp_name, dept_id`
`FROM employees;`
- `SELECT dept_id, dept_name`
`FROM departments`
`WHERE location = 'Cairo';`

DISTINCT Keyword

- It's a **row** keyword that displays unique rows
- Example

Employees table

| EmpNo | Name | DNo | JobID |
|-------|---------|-----|-----------|
| 100 | Ahmed | 2 | Sales_Rep |
| 200 | Mai | 2 | IT_PROG |
| 300 | Ali | 2 | Sales_Rep |
| 400 | Mahmoud | 3 | Sales_Rep |

Output

| DNo |
|-----|
| 2 |
| 3 |

- **SELECT DISTINCT DNo**
FROM employees;

DISTINCT Keyword (cont.)

- Example

Employees table

| EmpNo | Name | DNo | JobID |
|-------|---------|-----|-----------|
| 100 | Ahmed | 2 | Sales_Rep |
| 200 | Mai | 2 | IT_PROG |
| 300 | Ali | 2 | Sales_Rep |
| 400 | Mahmoud | 3 | Sales_Rep |

- SELECT **DISTINCT** DNo,JobID
FROM employees;

Output

| DNo | JobID |
|-----|-----------|
| 2 | Sales_Rep |
| 2 | IT_PROG |
| 3 | Sales_Rep |
